

# COLLECTING THE EGGS EASILY AND SUCCESSFULLY WITH SENSE

An IVF cycle involves several different steps that will help you increase the chances of becoming pregnant. One of the first steps is collecting the eggs in order to begin the treatment.

According to two studies, egg collection with the Sense needle gives significantly less bleeding compared to a conventional needle.\*

Egg collection with Sense gives you less overall pain, less bleeding, without prolonging the egg collection procedure or damaging the eggs.

Using Sense also reduces the overall pain experience. With Sense, patients experience 19% lower pain compared to egg collections using a conventional needle.

The unique design of Sense, with a thin tip and a larger needle body, provides ideal aspiration conditions and improved patient comfort during and after the procedure.

A successful egg collection needs to be fast, precise and retrieve the maximal amount of undamaged eggs without complications.

Ask your clinician to find out more about Sense and how it can help improve your chances for a successful IVF treatment. More information also available on [www.vitrolife.com](http://www.vitrolife.com).
